

ROS 2 Cheats Sheet

colcon - collective construction

colcon is a command line tool to improve the workflow of building, testing and using multiple software packages. It automates the process, handles the ordering and sets up the environment to use the packages.

All colcon tools start with the prefix 'colcon' followed by a command and (likely) positional/optional arguments.

For any tool, the documentation is accessible with,

\$ colcon **command** --help

Moreover, colcon offers auto-completion for all verbs and most positional/optional arguments. E.g.,

\$ colcon **command** [tab][tab]

Find out how to enable auto-completion at [colcon's online documentation](#).

Environment variables:

- CMAKE_COMMAND The full path to the CMake executable.
 - COLCON_ALL_SHELLS Flag to enable all shell extensions.
 - COLCON_COMPLETION_LOGFILE Set the logfile for completion time.
 - COLCON_DEFAULTS_FILE Set path to the yaml file containing the default values for the command line arguments (default:\$COLCON_HOME/defaults.yaml).
 - COLCON_DEFAULT_EXECUTOR Select the default executor extension.
 - COLCON_EXTENSION_BLACKLIST Blacklist extensions which should not be used.
 - COLCON_HOME Set the configuration directory (default: ~/.colcon.)
 - COLCON_LOG_LEVEL Set the log level (debug—10, info—20, warn—30, error—40, critical—50, or any other positive numeric value).
 - COLCON_LOG_PATH Set the log directory (default: \$COLCON_HOME/log).
 - CTEST_COMMAND The full path to the CTest executable.
 - POWERSHELL_COMMAND The full path to the PowerShell executable.
-

Global options:

- --log-base <path> The base path for all log directories (default: log).
 - --log-level <level> Set log level for the console output, either by numeric or string value (default: warn)
-

build Build a set of packages.

Examples:

Build the whole workspace:

\$ colcon build

Build a single package excluding dependencies:

\$ colcon build --packages-selected demo_nodes_cpp

Build two packages including dependencies, use symlinks instead of copying files where possible and print immediately on terminal:

```
$ colcon build --packages-up-to demo_nodes_cpp \
  action_tutorials --symlink-install \
  --event-handlers console_direct+
```

extension-points List extension points.

extensions Package information.

info List extension points.

list List packages, optionally in topological ordering.

metadata Manage metadata of packages.

Examples:

```
$ ros2 interface show geometry_msgs/msg/Pose
```

test Test a set of packages.

Example:

Test the whole workspace:

\$ colcon test

Test a single package excluding dependencies:

\$ colcon test --packages-select demo_nodes_cpp

Test a single package including dependencies, and print immediately on terminal:

```
$ colcon test --packages-select demo_nodes_cpp \
  --event-handlers console_direct+ --pytest-args -s
```

test-result Show the test results generated when testing a set of packages.

version-check Compare local package versions with PyPI. Examples:

```
$ ros2 msg show geometry_msgs/msg/Pose
```

Must know colcon flags.

--symlink-install

--event-handlers console_direct+ Show output on console.

--event-handlers console_cohesion+ Show output on console after a package has finished.

--packages-select Build only specific package(s).

--packages-up-to Build specific package(s) and its/their dependencies.

--packages-above Build package(s) depending on specific package(s).

--packages-above Build package(s) depending on specific package(s).
